## Health Minute

## Fabulous Fiber...

A fiber-rich diet may help control levels of a blood protein linked to an increased risk of heart disease. A study published in the American Journal of Clinical Nutrition found that out of 524 people, the ones with the highest fiber intake had lower levels of C-reactive protein (CRP). CRP is a marker of ongoing inflammation in the body. Consistently high levels of CRP can be a risk factor for future heart disease. The theory is that fiber helps to lower cholesterol and blood sugar, both of which can contribute to inflammation.

## Did you know?

Most Americans get about half of the recommended 20-35 grams of fiber per day. High-fiber diets can lower your risk of colon cancer. Fiber can help prevent flares of painful diverticulitis. Fiber can prevent and relieve constipation

## How to get your daily fiber

Choose foods with "bran,"
"whole wheat," and "whole grain"
Eat whole fruit instead of juice
(1 medium apple = 3g fiber)
Eat the skins of vegetables
(potato with skin = 4g fiber)
Add beans as a side dish (1/2 cup kidney beans= 8g fiber)

Use brown rice instead of white (1 cup brown rice = 3g fiber)
